# 1 Introduction

The classes described in this document wrap the Katana and KMotion class for SOAP

For API documentation of the original Katana and KMotion Python classes, see the Standalone Python Interface API Documentation (Document Number 233572).

Data types are converted recursively:

- vector to SOAPpy.arrayType (no matter if vectori, vectord, vectors, vectorvectors or trajectorysectionvector)
- list to SOAPpy.arrayType
- SOAPpy.arrayType representing vector or list to according vectord, trajectorysectionvector, pathpointlist, ...
- pathPoint or trajSection to SOAPpy.structType
- SOAPpy.structType to pathPoint or trajSection respectively

Arguments by reference to hold return values are not supported by SOAP and thus removed. The return value of the affected functions is a SOAPpy.structType with the element 'status' (the original status return value) and an element for each original 'by-reference argument' named after this.

The arguments and return values contain the following complex datatypes:

- SOAPpy.arrayType polynomials
  - Return value of calcP2P, calcLinear, calcArcus, calcPath, calcPathReverse, calcTrajectory
  - Normally, these functions are not used by end users. They are designed for internal use
  - A SOAPpy.arrayType polynomials consists of a number of SOAPpy.arrayType polynomial
  - A SOAPpy.arrayType polynomial consists of short int values representing a polynomial
- SOAPpy.arrayType points
  - Argument of calcPath, calcPathReverse, movePath, movePathReverse
  - A SOAPpy.arrayType points consists of a number of SOAPpy.structType pathPoint
  - A SOAPpy.structType pathPoint consists of:
    - \* A field 'time' of type double representing the relative time of this point on the path in seconds
    - \* A field 'configuration' of type SOAPpy.arrayType consisting of integer values representing the encoder values of the configuration of this point on the path
- SOAPpy.arrayType trajectory
  - Argument of calcTrajectory, moveTrajectory, moveTrajectoryReverse
  - A SOAPpy.arrayType trajectory consists of a number of SOAPpy.structType trajSection
  - A SOAPpy.structType trajSection consists of:
    - \* A field 'type' of type integer representing the type of this trajectory section: arcus=0, linear=1
    - \* A field 'velocity' of type double representing the maximum velocity of this trajectory section
    - \* A field 'startPoint' of type SOAPpy.arrayType consisting of double values representing the pose of the start point of this trajectory section
    - \* A field 'endPoint' of type SOAPpy.arrayType consisting of double values representing the pose of the end point of this trajectory section
    - \* A field 'interpolationPoint' of type SOAPpy.arrayType consisting of double values representing the pose of the intermediate point of a arcus trajectory section; on a linear trajectory section, this field is ignored and can be an empty SOAPpy.arrayType
